

A state composed from the factorization's parts generates the answer — the interaction term is not needed

Query-position patch at the workspace band, 1.7b, 224 (pair, operand) cells. Every variant includes  $\mu$  (the hook REPLACES the residual, so a variant must be a plausible state).  
“full (donor)” =  $\mu$  + operand + operator + interaction is the real donor activation by construction. “held-out cell” rebuilds the operand and operator components WITHOUT ever seeing the target cell.  
CIs: operator-level cluster bootstrap.
