

Every ordered operator swap flips, with uncertainty shown
family level (operators as clusters): contrast +22.6 [+14.0, +32.1] · flip fraction 100% [100%, 100%]

dots = swap per operand (orange, median 12/pair; 4 on the syncretic demonym–language pairs) · gray x = matched-norm random · bar = operand-bootstrap 95% CI · ○ = clean baseline mean
20 ordered pairs share 5 operator directions — pairs are not independent; operands are the unit within a pair, operators across the paradigm.
