

A state composed from the factorization's parts generates the answer — the interaction term is not needed

Query-position patch at the workspace band, 1.7b, 224 (pair, operand) cells. Every variant includes μ (the hook REPLACES the residual, so a variant must be a plausible state).
“full (donor)” = μ + operand + operator + interaction is the real donor activation by construction. “held-out cell” rebuilds the operand and operator components WITHOUT ever seeing the target cell.
CIs: operator-level cluster bootstrap.
