

Where the operator is represented is not where it acts

1.7b. Blue: operator variance share of the two-way ANOVA at that layer (query position). Orange: all-pairs swap contrast when the direction is built AND injected at that single layer (shaded = 95% CI). Held-out-oprand decodability is 100%–100% at every layer — the operator token is present in the prompt, so mere readability locates nothing; these two curves do.
